Warranty and Preventive Maintenance for Remanufactured Products Ammar Y. Alqahtani,Surendra M. Gupta,2018-12-12 The exponential increase in the development of technology coupled with

the customers immense desire to possess the newest technological products makes for truncated product lifespans which instigates a substantial upsurge in their rate of disposal Attempts have been made to establish specialized product recovery facilities with the intention of diminishing the volume of accumulated waste delivered to landfills using product recovery procedure such as remanufacturing The economic benefits produced by remanufacturing also portray the role of product recovery in a more attractive light The quality of a remanufactured product is uncertain for some consumers Therefore these consumers possess insecurities in deciding whether or not the remanufactured products will render the same expected performance This ambiguity regarding a remanufactured product could possibly result in the consumer deciding against its purchase With such consumer apprehension remanufacturers often seek market mechanisms that provide reassurance as to the stable durability that these products still maintain One strategy that the remanufacturers often use is the utilization of the premise of offering product warranties with preventive maintenance on their products This book is concerned with the practice and theory of warranty management and preventive maintenance particularly in relation to remanufactured products warranties Models developed in this book can be used for making the right decisions in offering renewable nonrenewable one and two dimensional warranty policies and for managerial decision in considering maintenance contracts or outsourcing maintenance for remanufactured components and products Features Discusses a variety of warranty policies and preventive maintenance of remanufactured products first book to do so Presents mathematical models and applications for warranty policies using examples and simulation results Considers cost and optimization problems from the remanufacturer s and buyer s points of views Provides a foundation for academicians interested in building models in the area of warranty and preventive maintenance analysis of remanufactured products Offers the essential methodology needed by practitioners involved with warranty and preventive maintenance analysis along with extensive references for further research

Maintenance models for systems subject to measurable deterioration Robin Pieter Nicolai, 2008 Complex engineering systems such as bridges roads

flood defence structures and power pylons play an important role in our society Unfortunately such systems are subject to deterioration meaning that in course of time their condition falls from higher to lower and possibly even to unacceptable levels Maintenance actions such as inspection local repair and replacement should be done to retain such systems in or restore them to acceptable operating conditions After all the economic consequences of malfunctioning infrastructure systems can be huge In the life cycle management of engineering systems the decisions regarding the timing and the type of maintenance depend on the temporal uncertainty associated with the deterioration Hence it is of importance to model this uncertainty In the literature deterioration models based on Brownian motion and gamma process have had much attention but a thorough comparison of these models lacks In this thesis both models are compared on several aspects both in a theoretical as well as in an empirical setting Moreover they are compared with physical process models which can capture structural insights into the underlying process For the latter a new framework is developed to draw inference Next models for imperfect maintenance are investigated Finally a review is given for systems consisting of multiple components
