Biophysics and Neurophysiology of the Sixth Sense Nima Rezaei, Amene Saghazadeh, 2019-04-26 Multiple senses like multiple intelligences are a key to brain variability and therefore human evolution Besides the traditional five senses vision olfaction gustation audition and somatosensory humans can also perceive the body's own position the sense of proprioception and movement the vestibular sense Interoception is the feeling one has about the internal physiological conditions of the entire body Additionally there is a sense of intuition also known as the sixth sense Despite their best efforts researchers are still unable to concur in specifying the nature of the sixth sense some consider the sense of proprioception as the sixth sense whereas others prefer to consider that as a part of interoception This book will provide a scientific system for the human sixth sense using relevant biophysical and neurophysiological evidence The power of sixth sense seems to be underestimated due to difficulties in defining the concept clearly According to socioeconomics and neural physics the sixth sense is that which permits humans to create perception or to enhance the quality of their perception of events Roughly speaking the sixth sense engages a metacognitive process through which prior knowledge and the information received from other sensory modalities are synergized It is not restricted to specific arrow of time and type of mind or to the observer's body but it considers all arrows of time past present future types of mind conscious and unconscious and physical bodies self

and other. However, it is expected that the observer has specific biases towards what happens now or would happen in the future and its relation to himself. Particularly, humans appeal to the sixth sense on the road to achieving success in social competitions and to reduce uncertainty in complex decision making processes. In addition to evidence linking genetic components to the sixth sense submodalities, there have been developed strategies for increasing the quality of perceptions provided by the sixth sense. Meditation, through which individuals try to be detached from the world, increases gamma band activity and that increased gamma band activity is found following top down processing. Therefore, it can be inferred that the detachment from the environment may enhance synchronization of the wave functions in favor of strengthening the sixth sense. It can serve as the mechanism of enhancement of the sixth sense in those whose sensory systems are intact; it can also serve as the mechanism of compensation in those who have sensory deficiencies. In the latter case, it in fact encourages creativity in the use of relatively strong senses. This justifies Beethoven's deafness and his great musical creativity or Bramblitt's blindness and his enormous capability to paint and many other similar examples. In summary, the present book is divided into five parts. Part 1, chapters 1-6, provides information about the system of proprioception and its neurophysiology and biophysics. Part 2, chapters 7-10, examines the system of interoception. The information provided in these two parts would enable us to move towards the next three parts of the story aimed at developing a scientific system of the sixth sense. The first chapter of part 3 begins with concepts and uses them to arrive at a reasonable conclusion that there must be a sense that requires multistep information processing and that is separate from the sense of proprioception and the sense of interoception. Such sense is commonly known as the sixth sense. However, it should be re-numbered because the sense of proprioception is already known as the sixth sense. The second chapter of this part is to draw neurocircuitry that innervates the sixth sense in the mind of a man while the third chapter would address the questions whether the sixth sense system requires an optimal competence or consciousness of mind to function properly and if so, which is the optimal state: conscious or unconscious and competence or incompetence. In the fourth chapter of this part, we will focus on the self/other mergence as a pivotal step of the sixth sense system. The next chapter would be of great interest to neurobiologists. It talks about that the human sixth sense of the unseen world, either the unseen arrow of time or the unseen events, requires creativity and therefore the human sixth sense should be considered a source of creativity, variability, and thus evolution. In the sixth chapter, the sixth sense is viewed as an economic activity stimulated by social environments. This chapter arises from the fact that humans are full of enthusiasm to heighten their sixth sense and its accuracy and that they owe their enthusiasm largely to achieving the best possible profit and in other words, to winning intense competitions in their life, holds mainly on the concept of elasticity. Finally, this part is finished by an amazing discussion on the art of the sixth sense. The first chapter of part 4 discusses physical theories that support the existence of sixth sense in the universe. The next chapter is to apply the Bayes theory to the sixth sense, leading to the conclusion that the sixth sense improves multisensory integration through optimizing

uncertainty of information received from other sensory modalities Chapter three in this part would address whether relative timing is applicable to the sixth sense like other senses The last part of book aimed at directly discussing the sixth sense into the context of human health and behavior is organized into four chapters The first chapter is to discuss neurodevelopmental changes in the sixth sense while the second and third ones will discuss that in relation to psychiatric and neurological disorders The most striking question how much power the sixth sense the sixth sense have over human health and behavior is addressed in the fourth chapter of this part and final chapter of book which will be prepared using neural network models and sophisticated portraits possible for the system of sixth sense
