Controller Address: 0
☒ Enable Fresh System Connections
☒ Auto Logging ON
 TxPwr Display Units: [dBm] [dBm + 1mW]

Communications Port

Com Port: Com 1
 Speed: 19200 bps
☒ Status Poll Alarm
☒ Switch Base Alarm

Buttons: Apply Changes, Exit

Communications Port

With the pull down box, select the required communications port. Com 1 to Com 16. Select the required com port speed (9600 or 19200 bps). Default is 19200 bps.

Controller Address

Normally set to 0. Networks which have multiple controllers active, should use different controller addresses, so responses from remotes are ignored if the poll was not sent by that controller.

Enable SID Codes

Enabled or disabled (Default enabled). In some systems, external application of SID codes is used as a method of giving the modems in the system specific data addresses. The modems are placed into the "stream routing" mode, and the user (e.g. Diagnostic controller) supplies the SID code at the start of each data packet to be transmitted. In this way the user can "steer" the data flow through the given network path.

Should the diagnostics controller be used in such a network then it too needs to append the data addresses or SID codes to the beginning of all data messages sent.

In the controllers database record for each modem, a field is supplied where the user can select the SID code for that particular modem. By selecting the Diagnostic SID code that suits the system topology, the diagnostics data messages can be routed successfully to the correct destination.

Auto Logging ON

When enabled all logging functions will be activated when polling is turned on.

Alert Tones

When enabled will emit a tone from the PC speaker or sound card when Status poll alarms occur and/or Base Station change overs occur.

Tx Power Display Units

Select either "dBm" or "milli Watts" as the display units. Power will be displayed throughout the system in the selected power measurement unit.

Note: Power will always be stored in the database file as milli-watts
