Garcia-Carranca, 2012-12-06 The establishment of microinjection protocols about 20 years ago for cultured cells and shortly thereafter for the generation of transgenic mice by microinjection of DNA into fertilized mouse eggs greatly influenced many fields of biology Not only have the data generated using these approaches contributed to a large extent to our present understanding of gene regulation and cellular function of higher eukaryotic cells but current knowledge and future developments in this area will certainly have a great impact on basic and applied research for many years to come This laboratory manual describes the current state of the art in this research area and focuses primarily on both the experimental strategies with an extensive bibliography and the detailed procedures A large number of studies are presently being performed and a great variety of new experimental designs are rapidly being developed The book contains protocols on injection of somatic cells as well as on injection of embryos the use of similar equipment being a common feature In the articles dedicated to somatic cells full descriptions of the manual and automatic injection systems are given as well as the methods for the analysis of injected cells by video microscopy electron microscopy or in situ hybridizations In addition comprehensive protocols are given for injection experiments with very different purposes such as to study signal transduction or microtubule dynamics

Imaging Neurons Rafael Yuste, Frederick Lanni, Arthur Konnerth, 2000 In the past decade advances in microscopy have been coupled with new methods of culturing and labeling cells to generate the new science of imaging Imaging technologies allow investigators to look directly inside living cells and probe their form and function in unprecedented detail This approach is revolutionizing many aspects of biomedical research particularly neuroscience in which visual techniques have traditionally been so important This manual is the first comprehensive description of the range of imaging technologies being applied to living cells With its origins in a laboratory course taught at Cold Spring Harbor Laboratory by the editors and contributors it is packed with the kind of technical detail and practical advice that are essential for success yet seldom found in the research literature It covers both established methods and cutting edge techniques such as multiphoton excitation microscopy and imaging of genetically

engineered probes Although it is neurons to which these technologies are most commonly applied the methods described are readily adaptable to many other cell types This book will therefore be an invaluable aid to investigators in cell and developmental biology and immunology as well as neuroscience who wish to take advantage of the extraordinary insights into cellular function offered by imaging technologies

Image Processing and Analysis ,1999-12-09 A wide range of books on image processing and analysis provide comprehensive descriptions of mathematics and algorithms for image processing practitioners or introductory material for engineering students This volume is different in addressing the topic from the point

of view of the user Standard algorithms procedures and rules of thumb are explained in the context of successful application to biological or medical images Early chapters cover the basic topics of image acquisition processing analysis and pattern recognition Much of the explanation is in the form of protocols which should equip the user in the biological or earth sciences with the background for informed use of image processing software and sufficient knowledge to write their own programmes if they feel moved to do so More advanced techniques in the use of explicit models and analysis of 3D images are covered in later chapters also with reference to specific applications The coverage of these is not exhaustive but may inspire the reader to consider applying image analysis to problems beyond those tackled by commercial packages
