CHAPTER 0

Ex. 0.2. Define $H: (\mathbf{R}^n - \{0\}) \times I \rightarrow \mathbf{R}^n - \{0\}$ by

$$H(x, t) = (1 - t)x + \frac{t}{\|x\|}x.$$

$x \in \mathbf{R}^n - \{0\}$, $t \in I$. It is easily verified that H is a homotopy between the identity map and a retraction onto S^{n-1} , i.e. a deformation retraction.

Ex. 0.3. First a few results which make things easier.

Lemma 1. Let f_0, f_1 and f_2 be maps $X \rightarrow Y$. If $f_0 \simeq f_1$ and $f_1 \simeq f_2$ then $f_0 \simeq f_2$.

Proof. Let $F_0: X \times I \rightarrow Y$ be a homotopy between f_0 and f_1 , and $F_1: X \times I \rightarrow Y$ a homotopy between f_1 and f_2 .

Define $F: X \times I \rightarrow Y$ by

$$F(x, t) = \begin{cases} F_0(x, 2t), & t \in [0, 1/2] \\ F_1(x, 2t - 1), & t \in [1/2, 1]. \end{cases}$$

If $t = 1/2$ then $F_0(x, 2t) = F_0(x, 1) = f_1(x) = F_1(x, 0) = F_1(x, 2t - 1)$, i.e. the map F is well-defined. By the pasting lemma, F is continuous. Since $F(x, 0) = F_0(x, 0) = f_0(x)$ and $F(x, 1) = F_1(x, 1) = f_2(x)$, F is a homotopy between f_0 and f_2 . \square

Lemma 2. If $f_0, f_1: X \rightarrow Y$ are homotopic and $g_0, g_1: Y \rightarrow Z$ are homotopic then $g_0 f_0, g_1 f_1: X \rightarrow Z$ are homotopic.

Proof. Let $F: X \times I \rightarrow Y$ be a homotopy between f_0 and f_1 , and let $G: Y \times I \rightarrow Z$ be a homotopy between g_0 and g_1 .

One proof: Now the composite $g_0 F: X \times I \rightarrow Z$ is a homotopy between $g_0 f_0$ and $g_0 f_1$, and the composite $G(f_1 \times \text{id}_I): X \times I \rightarrow Z$ is a homotopy between $g_0 f_1$ and $g_1 f_1$. By lemma 1, $g_0 f_0 \simeq g_1 f_1$.

Another proof: The map $G(F \times \text{id}_I)(\text{id}_X \times \Delta): X \times I \rightarrow Z$ is continuous, where $\Delta: I \rightarrow I \times I$ is the diagonal map, that is, $\Delta(t) = (t, t)$. Since

$$G(F \times \text{id}_I)(\text{id}_X \times \Delta)(x, 0) = G(F \times \text{id}_I)(x, 0, 0) = G(F(x, 0), 0) = g_0 f_0(x)$$

and

$$G(F \times \text{id}_I)(\text{id}_X \times \Delta)(x, 1) = G(F \times \text{id}_I)(x, 1, 1) = G(F(x, 1), 1) = g_1 f_1(x),$$

$g_0 f_0$ and $g_1 f_1$ are homotopic. \square

(a). Suppose $f_0: X \rightarrow Y$ is a homotopy equivalence with homotopy inverse $f_1: Y \rightarrow X$, and $g_0: Y \rightarrow Z$ is a homotopy equivalence with homotopy inverse $g_1: Z \rightarrow Y$.

Using lemma 2, $f_1 g_1 g_0 f_0 \simeq f_1 \text{id}_Y f_0 = f_1 f_0 \simeq \text{id}_X$ and $g_0 f_0 f_1 g_1 \simeq g_0 \text{id}_Y g_1 = g_0 g_1 \simeq \text{id}_Z$. In other words, $g_0 f_0: X \rightarrow Z$ is a homotopy equivalence.

Since being homotopy equivalent clearly is reflexive and symmetric, homotopy equivalence among spaces is an equivalence relation.

Hatcher Topology Solutions:

Topology of Numbers Allen Hatcher, 2022-10-19 This book serves as an introduction to number theory at the undergraduate level emphasizing geometric aspects of the subject. The geometric approach is exploited to explore in some depth the classical topic of quadratic forms with integer coefficients, a central topic of the book. Quadratic forms of this type in two variables have a very rich theory developed mostly by Euler, Lagrange, Legendre, and Gauss during the period 1750-1800. In this book, their approach is modernized by using the splendid visualization tool introduced by John Conway in the 1990s called the topograph of a quadratic form. Besides the intrinsic interest of quadratic forms, this theory has also served as a stepping stone for many later developments in algebra and number theory. The book is accessible to students with a basic knowledge of linear algebra and arithmetic modulo n . Some exposure to mathematical proofs will also be helpful. The early chapters focus on examples rather than general theorems, but theorems and their proofs play a larger role as the book progresses.

Algebraic Topology Allen Hatcher, 2002 In most mathematics departments at major universities, one of the three or four basic first-year graduate courses is in the subject of algebraic topology. This introductory textbook in algebraic topology is suitable for use in a course or for self-study, featuring broad coverage of the subject and a readable exposition with many examples and exercises. The four main chapters present the basic material of the subject: fundamental group and covering spaces, homology, and cohomology, higher homotopy groups, and homotopy theory generally. The author emphasizes the geometric aspects of the subject, which helps students gain intuition. A unique feature of the book is the inclusion of many optional topics which are not usually part of a first course due to time constraints and for which elementary expositions are sometimes hard to find. Among these are Bockstein and transfer homomorphisms, direct and inverse limits, H spaces, and Hopf algebras, the Brown representability theorem, the James reduced product, the Dold-Thom theorem, and a full exposition of Steenrod squares and powers. Researchers will also welcome this aspect of the book.

Lectures on Differential Geometry Bennett Chow, Yutze Chow, 2024-09-23 Differential geometry is a subject related to many fields in mathematics and the sciences. The authors of this book provide a vertically integrated introduction to differential geometry and geometric analysis. The material is presented in three distinct parts: an introduction to geometry via submanifolds of Euclidean space, a first course in Riemannian geometry, and a graduate special topics course in geometric analysis. It contains more than enough content to serve as a good textbook for a course in any of these three topics. The reader will learn about the classical theory of submanifolds, smooth manifolds, Riemannian geometry, bundles, connections, and curvature, the Chern-Gauss-Bonnet formula, harmonic functions, eigenfunctions, and eigenvalues on Riemannian manifolds, minimal surfaces, the curve shortening flow, and the Ricci flow on surfaces. This will provide a pathway to further topics in geometric analysis, such as Ricci flow, used by Hamilton and Perelman to solve the Poincaré and Thurston geometrization conjectures, mean curvature flow, and minimal submanifolds. The book is primarily aimed at graduate students in geometric analysis, but it will also be of

interest to postdoctoral researchers and established mathematicians looking for a refresher or deeper exploration of the topic

Generalized Solutions of Nonlinear Partial Differential Equations E.E. Rosinger, 1987-11-01 During the last few years several fairly systematic nonlinear theories of generalized solutions of rather arbitrary nonlinear partial differential equations have emerged The aim of this volume is to offer the reader a sufficiently detailed introduction to two of these recent nonlinear theories which have so far contributed most to the study of generalized solutions of nonlinear partial differential equations bringing the reader to the level of ongoing research The essence of the two nonlinear theories presented in this volume is the observation that much of the mathematics concerning existence uniqueness regularity etc of generalized solutions for nonlinear partial differential equations can be reduced to elementary calculus in Euclidean spaces combined with elementary algebra in quotient rings of families of smooth functions on Euclidean spaces all of that joined by certain asymptotic interpretations In this way one avoids the complexities and difficulties of the customary functional analytic methods which would involve sophisticated topologies on various function spaces The result is a rather elementary yet powerful and far reaching method which can

among others give generalized solutions to linear and nonlinear partial differential equations previously unsolved or even unsolvable within distributions or hyperfunctions Part 1 of the volume discusses the basic limitations of the linear theory of distributions when dealing with linear or nonlinear partial differential equations particularly the impossibility and degeneracy results Part 2 examines the way Colombeau constructs a nonlinear theory of generalized functions and then succeeds in proving quite impressive existence uniqueness regularity etc results concerning generalized solutions of large classes of linear and nonlinear partial differential equations Finally Part 3 is a short presentation of the nonlinear theory of Rosinger showing its connections with Colombeau's theory which it contains as a particular case **Partial Differential**

Equations I Michael E. Taylor, 2023-12-06 The first of three volumes on partial differential equations this one introduces basic examples arising in continuum mechanics electromagnetism complex analysis and other areas and develops a number of tools for their solution in particular Fourier analysis distribution theory and Sobolev spaces These tools are then applied to the treatment of basic problems in linear PDE including the Laplace equation heat equation and wave equation as well as more general elliptic parabolic and hyperbolic equations The book is targeted at graduate students in mathematics and at professional mathematicians with an interest in partial differential equations mathematical physics differential geometry harmonic analysis and complex analysis The third edition further expands the material by incorporating new theorems and applications throughout the book and by deepening connections and relating concepts across chapters It includes new sections on rigid body motion on probabilistic results related to random walks on aspects of operator theory related to quantum mechanics on overdetermined systems and on the Euler equation for incompressible fluids The appendices have also been updated with additional results ranging from weak convergence of measures to the curvature of Kahler manifolds Michael E Taylor is a Professor of Mathematics at the University of North Carolina Chapel Hill NC Review of first edition These volumes will be read by several generations of readers eager to learn the modern theory of partial differential equations of mathematical physics and the analysis in which this theory is rooted Peter Lax SIAM review June 1998 The Universal Coefficient Theorem and Quantum Field Theory Andrei-Tudor Patrascu, 2016-09-23 This thesis describes a new connection between algebraic geometry topology number theory and quantum field theory It offers a pedagogical introduction to algebraic topology allowing readers to rapidly develop basic skills and it also presents original ideas to inspire new research in the quest for dualities Its ambitious goal is to construct a method based on the universal coefficient theorem for identifying new dualities connecting different domains of quantum field theory This thesis opens a new area of research in the domain of non perturbative physics one in which the use of different coefficient structures in co homology may lead to previously unknown connections between different regimes of quantum field theories The origin of dualities is an issue in fundamental physics that continues to puzzle the research community with unexpected results like the AdS CFT duality or the ER EPR conjecture This thesis analyzes these observations from a novel and original point of view mainly based on a

fundamental connection between number theory and topology Beyond its scientific qualities it also offers a pedagogical introduction to advanced mathematics and its connection with physics This makes it a valuable resource for students in mathematical physics and researchers wanting to gain insights into co homology theories with coefficients or the way in which Grothendieck s work may be connected with physics
