Hemostasis and Thrombosis Protocols David J. Perry, K. John Pasi, 2008-02-02 Laboratory studies in hemostasis have traditionally focused on abnormalities of platelet function or the quantitative and qualitative disorders that affect the proteins involved in blood coagulation However over the last 10 years there has been an explosion in our understanding of the molecular bases that underlie many of the inherited and acquired disorders of hemostasis Many of these disorders are now routinely diagnosed and assessed by methods that involve genotypic analysis Indeed in the late 1990s the distinction between molecular methods for research and for routine diagnosis is becoming increasingly blurred The techniques and approaches that are used in hemostasis are manifold and published in isolation in a variety of publications The aim therefore of this volume *Hemostasis and Thrombosis Protocols* is to pull together into a single volume the variety of techniques that are frequently used in the field of hemostasis We have targeted this volume at laboratories who wish to move into the field of molecular hemostasis or who may already have some experience in this area but wish to develop new areas of research and diagnosis The chapters are wide ranging and hopefully provide a broad overview of the differing applications in which these standard techniques can be used Though the articles may appear relatively specific the techniques contained within them are applicable to the study of many different disorders and we hope that they provide a series of ideas and concepts well suited to problem solving

Molecular Virology Chunfu Zheng, 2025-06-14 This detailed book presents classical and cutting edge techniques in molecular virology research The volume begins with guidelines for investigating viral structure proliferation processes and virulence factors followed by various approaches to identify key elements and molecular signaling pathways in virus infected host cells that regulate virus host interactions Additional chapters explore methods for studying autophagy post translational modifications of virus and host proteins epigenetic factors in anti viral immune responses and viral epidemiology Written for the highly successful *Methods in Molecular Biology* series chapters include introductions to their respective topics lists of the necessary materials

**Clinical Applications of Capillary Electrophoresis** Stephen M. Palfrey, 2008-02-01 In Clinical Applications of Capillary Electrophoresis Stephen Palfrey brings together for first time a collection of detailed capillary electrophoresis protocols designed exclusively for clinical applications Written by the leading scientists who have often perfected these methods in their own laboratories the protocols furnish new and more powerful assays for many routine serum and blood tests now regularly performed in clinical laboratories including urine protein analysis hemoglobin separation and the detection of CSF proteins lipoproteins myoglobin cryoglobulins HbA1c and cathepsin The protocols offered for DNA studies include double stranded DNA analysis the prenatal diagnosis of Down's syndrome Rh/D/d genotyping the identification of mutated p53 oncogene and the detection of microsatellite instability in cancers Many of the methods can be automated to replace the more costly and labor intensive tests that are currently used in most clinical laboratories Clinical Applications of

Capillary Electrophoresis demonstrates clearly the simplicity versatility and power of CE over conventional methods It offers to beginning clinical investigators as well as established laboratories new to the technique a representative range of highly practical CE methods assays that are not only certain to become ever more productive but are already eminently useful today

*NMDA Receptor Protocols* Min Li,2008-02-03 Min Li and a panel of hands on experimentalists detail state of the art molecular techniques for studying NMDA ligand gated ion channels and developing assays for nontherapeutic lead selection The topics range from cDNA cloning to in vitro and in vivo investigation of the channel complex in the mammalian brain Additional topics include the biochemical analysis of the channel protein and the construction of various heterologous systems for both basic research and high throughput screens HTS for pharmaceutical chemicals Although the focus is on NMDA receptors the methods are applicable to other ligand gated ion channels and with some modification may be extended to related membrane signaling receptors NMDA Receptor Protocols offers today s scientists powerful methods for basic research on NMDA receptor structure and function as well as enormous opportunities for clinical investigation toward the development of novel bioactive compounds

**Vaccinia Virus and Poxvirology** Stuart N. Isaacs,2008-02-03 The Right Book at the Right Time The poxviruses comprise a family of complex DNA viruses that replicate in the cytoplasm of vertebrate or invertebrate cells Of the eight recognized genera of vertebrate poxviruses those belonging to the orthopoxvirus genus have been most intensively studied This group includes variola virus the agent of smallpox as well as cowpox virus and vaccinia virus Jenner s original smallpox vaccine described in 1798 consisted of live cowpox virus but vaccinia virus later replaced it 1 There has been speculation as to the origin of vaccinia virus the most likely idea is that it is a separate species possibly originally isolated from a horse and is now extinct or rare in nature 2 Recent genome sequencing studies confirm the distinctness of variola virus cowpox virus and vaccinia virus and also their very close genetic relationship which accounts for the cross protection of smallpox vaccines The novelty of the smallpox vaccine can be readily appreciated by the time it took about 80 years before the next live vaccine against rabies was developed and another 50 years for the yellow fever vaccine Moreover the eradication of smallpox in 1977 stands as a unique medical achievement Because of its historical role smallpox vaccination contributed greatly to present concepts of infectious disease immunity and pathogenesis Less well known

however are the many other firsts for vaccinia virus Laboratory Techniques in Cellular and Molecular Medicine Hajdúch, Marián,Drábek, Jiří, The methodological book Laboratory techniques in cellular and molecular medicine is intended for students of bachelor master and doctoral study programmes at faculties of science medicine and veterinary medicine as well as for laboratory technicians interested in methodological approaches of contemporary cellular and molecular medicine The book does not aim to provide a comprehensive overview of the current state of the art in cellular and molecular medicine that would be a superhuman task The aim of the 56 member author team is to provide readers with an overview of the methods established and tested at the Institute of Molecular and Translational Medicine of the Faculty of Medicine of Palack

University Olomouc to describe the methodological principles and their practical application It focuses both on basic methods whose principles are used by the most modern methods and on special methods reflecting the laboratory experience and specialisation of individual authors The 52 chapters describe the work with cells and microorganisms bioengineering manipulations of nucleic acids the search for biomarkers detection at the level of DNA RNA protein organelle and whole cell and the use of fluorescent and radioactive labeling To aid comprehension the description of the methods is illustrated by figures and diagrams Each chapter is followed by troubleshooting tips The book promotes the best laboratory practice to increase the reproducibility of results in biomedicine

**Transcription Factor Protocols** Martin J. Tymms, 2008-02-03 The effort to sequence the human genome is now moving toward a conclusion As all of the protein coding sequences are described an increasing emphasis will be placed on understanding gene function and regulation One important aspect of this analysis is the study of how transcription factors relate transcriptional initiation by RNA polymerase II which is responsible for transcribing nuclear genes encoding messenger RNAs The initiation of Class II transcription is dependent upon transcription factors binding to DNA elements that include the core or basal promoter elements proximal promoter elements and distal enhancer elements General initiation factors are involved in positioning RNA polymerase II on the core promoter but the complex interaction of these proteins and transcriptional activators binding to DNA elements outside the core promoter regulate the rate of transcriptional initiation This initiation process appears to be a crucial step in the modulation of mRNA levels in response to developmental and environmental signals Transcription Factor Protocols provides step by step procedures for key techniques that have been developed to study DNA sequences and the protein factors that regulate the transcription of protein encoding genes This volume is aimed at providing researchers in the field with the well detailed protocols that have been the hallmark of previous volumes of the Methods in Molecular Biology series
