

LABORATORY 5

FREQUENCY RESPONSE OF A BJT AMPLIFIER

OBJECTIVES

1. To determine quiescent point of a common emitter and common collector amplifiers and calculate the values of the resistors R_C , R_E , R_1 and R_2 .
2. To measure upper and lower cutoff frequencies of a common-emitter amplifier.
3. To simulate amplifier frequency response measurements using MicroCap software.
4. To study the frequency response of the common emitter (CE) and common collector (CC) BJT transistor amplifiers in the low to medium frequency range (50 Hz to 1 MHz).

INFORMATION

In this lab, two BJT amplifier configurations will be investigated: the common-emitter, and the common collector amplifier. Both amplifiers typically use a self-biasing scheme and have a relatively linear output.

1. Common-Emitter Amplifier

The common emitter amplifier in Figure 5.1 is characterized by high voltage (A_v) and current gain (A_i). The amplifier typically has a relatively high input resistance (1 - 10 K Ω) and a fairly high output resistance. Therefore it is generally used to drive medium to high resistance loads. The circuit for the common-emitter amplifier can be seen in Figure 5.1. It is typically used in applications where a small voltage signal needs to be amplified to a large voltage signal. Since the amplifier cannot drive low resistance loads, it is usually cascaded with a buffer that can act as a driver.
